

Ayurveda & Traditional Knowledge Compendium (Page 1)

1. Classical Formulations and Polyherbal Science

Classical Ayurvedic pharmacology (Dravyaguna and Bhasajya Kalpana) emphasizes polyherbal formulations categorized as Churna (powders), Asava/Arishta (fermented decoctions), Kwatha (extracts), and Ghrita (medicated ghee). Key herbs such as Neem (*Azadirachta indica*), Ashwagandha (*Withania somnifera*), Turmeric (*Curcuma longa*), and Tulsi (*Ocimum sanctum*) have defined therapeutic profiles in ancient Ayurvedic treatises.

2. Classical Text References & Documentation

The authoritative Ayurvedic texts referenced under the First Schedule of the Drugs and Cosmetics Act include Charaka Samhita, Sushruta Samhita, Astanga Hridaya, and Sharangadhara Samhita. Any formulation prepared strictly following the recipes, methods, and indications described in these authoritative texts is classified as a Classical Ayurvedic Medicine.

3. Traditional Knowledge Digital Library (TKDL)

The Traditional Knowledge Digital Library (TKDL) is a pioneering Indian database that translates and organizes traditional knowledge from classical Sanskrit, Urdu, Arabic, and Tamil texts into five international languages (English, French, German, Japanese, Spanish). TKDL provides International Patent Offices with documented prior art to prevent misappropriation and bio-piracy of Indian traditional knowledge.

4. Patent Examination and TKDL Prior Art Citations

When an Ayurvedic researcher files a patent, patent examiners search TKDL. If the claimed formulation, herb extract, or therapeutic use is documented in TKDL, the claim is rejected for lack of novelty under Section 3(p). Applicants must clearly disclose novel extraction methodologies, novel delivery systems (e.g. nano-carriers), or non-obvious synergistic combinations not found in classical literature.
